

# Green Frog

Northern green frogs are between 2 1/8 to 3 1/2 inches in size. They look similar to small bullfrogs. Northern green frogs range in color from green or brown to olive-brown, with a white underside and darker spots/lines where belly meets the green/brown side. Males typically have bright yellow throats.

Green frogs are primarily nocturnal, but are also sometimes active during the day.

## Habitat

This species is typically found wherever there is shallow, semi-permanent freshwater particularly along the edges of lakes and ponds

Green frogs produce as many as 6 different calls. Males trying to attract a mate start calling at the beginning of May and continue into August. The call is a single, 1 syllable "gungk", often described as the sound made by plucking a loose banjo string.

## Diet

Insects, mollusks, crustaceans, fish, other frogs, vegetable matter, and shed skins; juveniles eat plant matter in water • At the
